

Finally, a file transfer tool that actually works with everyone.

Tired of the nightmare of sharing files between Android and iPhone? Frustrated by low-quality video compression on messaging apps? BRIDGE solves the chaos of file sharing by turning your phone into a temporary, high-speed local server.

BRIDGE is FREE offline file transfer solution that breaks down walls between devices. Whether you are sending a 500MB video, a presentation, or a folder of photos, Bridge gets it done in seconds without using a single byte of mobile data.

 The Genius Twist: The Receiver Needs Nothing! Unlike other sharing apps, the person receiving the file does NOT need to install Bridge.

1. You select the file.
2. They connect to your local Hotspot and scan your QR code.
3. They download the file directly through their web browser (Safari, Chrome, etc.)

 Key Features:

- True Cross-Platform Sharing: Works perfectly from Android to iPhone, iPad, Mac, Windows PC, or Linux. If it has a browser and Wi-Fi, it works.
- 100% Offline: No internet? No problem. Bridge uses local Wi-Fi. Works in basements, remote nature spots, or airplanes.
- Original Quality: Send full-resolution videos and photos. No compression, no quality loss.
- Lightning Fast: Transfers happen over local Wi-Fi speeds, much faster than Bluetooth or cloud uploads.
- Secure & Private: Your data never touches the cloud. It transfers directly from your device to theirs using a local HTTP server.
- Absolutely FREE and without annoying ads! The App includes a "Donate" button for users who wish to support development.

 Perfect For:

- Events & Churches: Pastors can instantly share sermon PDFs or announcements to the whole congregation. Just project the QR code!
- Photographers & Creators: Send huge raw files to a client's iPad or laptop instantly on location.
- Families: Share that 4K vacation video with Grandma's iPad without explaining how to install an app.
- The Office: Move files from your phone to your PC wirelessly without hunting for cables.

How to Use Bridge:

1. Turn on your Hotspot (prompted inside the app).
2. Select your files (Photos, Videos, Docs).
3. Show the generated QR Code to the recipients.
4. They scan it, a browser page opens, and they click Download.

Stop struggling with compatibility issues. Build a BRIDGE.
